

ABSTRACT OF THE DISCLOSURE

In the present invention, when one signal line group and another signal line group which differs from one signal line group in length are arranged adjacent to each other, a disconnection due to static electricity which is caused by a spark generated between a signal line of one signal line group and a signal line of another signal line group which are arranged adjacent to each other can be prevented. The image signal line is specifically configured such that, on a substrate, a first signal line group in which a plurality of first signal lines are arranged in parallel and a second signal line group in which a plurality of second signal lines are arranged in parallel in a region arranged adjacent to the first signal line group are formed and dummy lines are arranged between the first signal line group and the second signal line group.
